Three questions about outreach performance

1. How did daily outreach productivity change before and after CX360 went live?

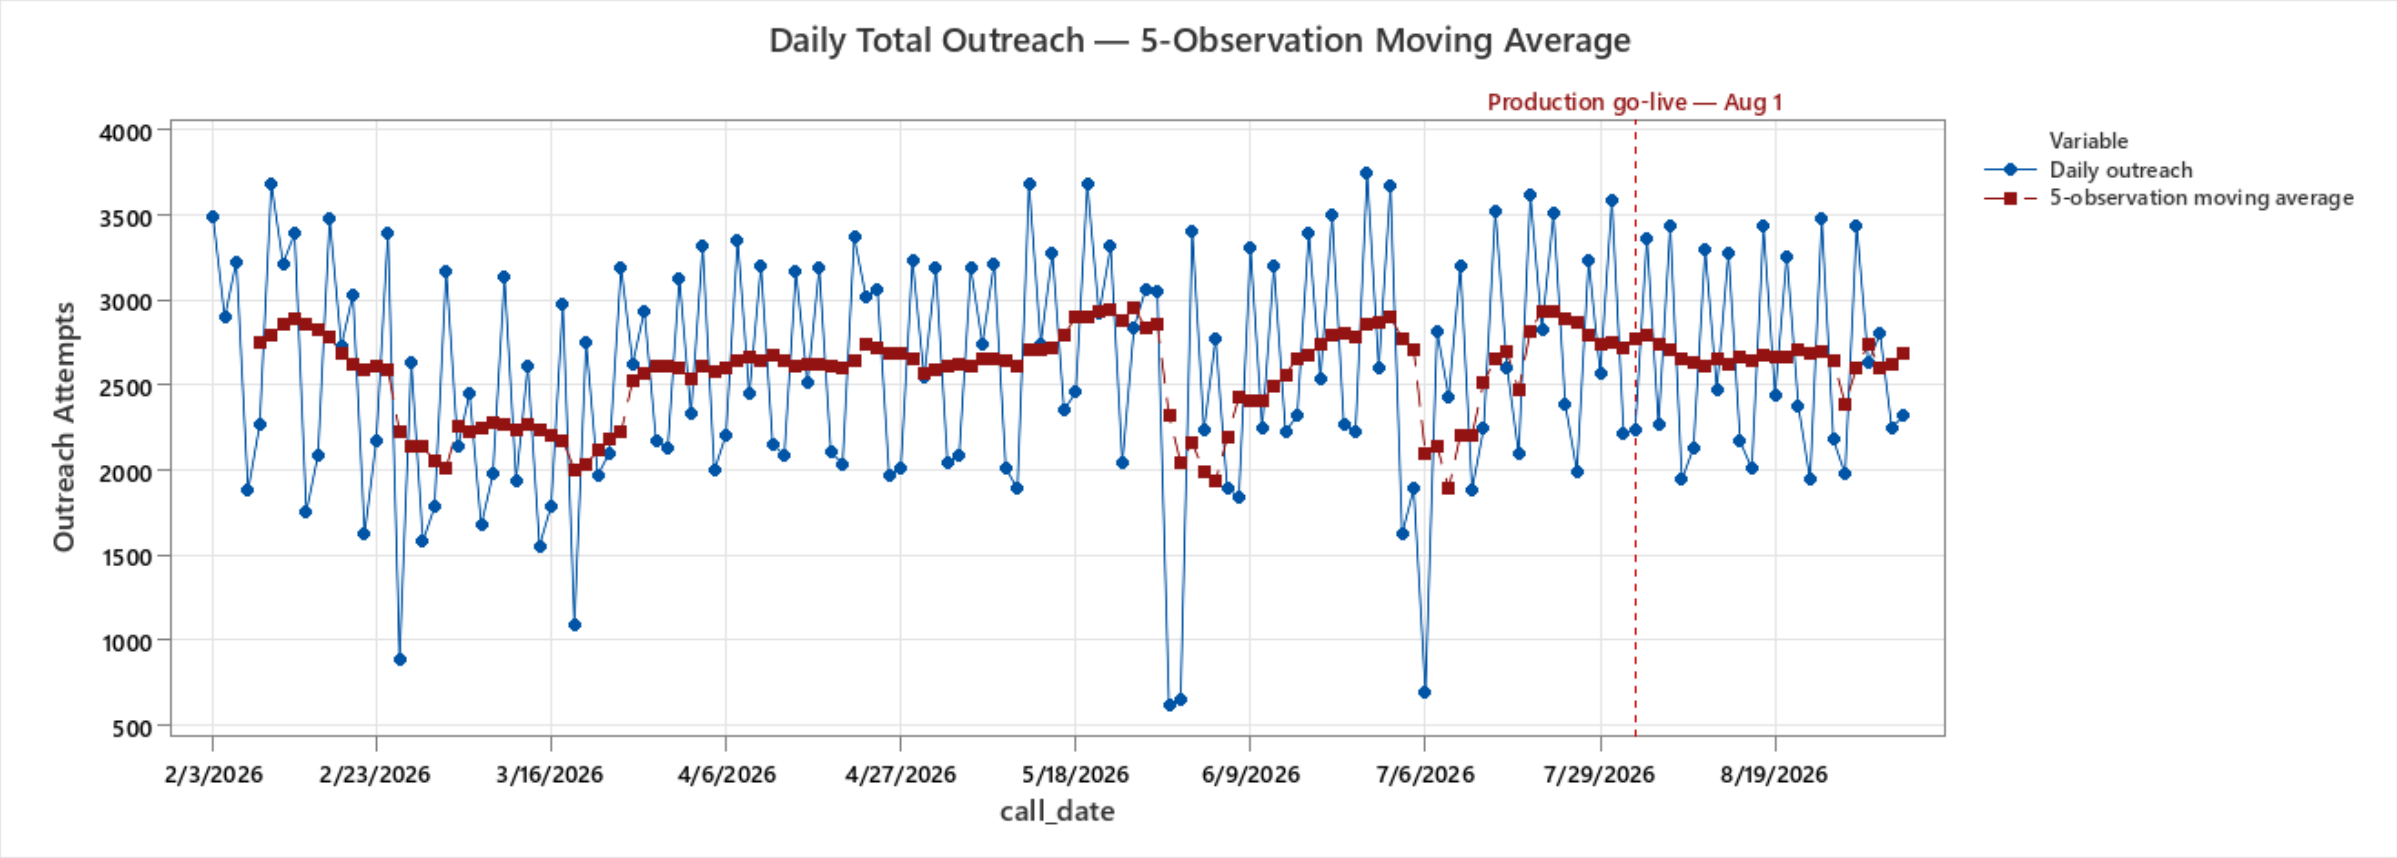

2. While we continue monitoring the overall trend, where can we act now to improve outreach success?

3. Beyond improving contact success, what can our QA findings tell us about avoiding unnecessary calls and making each successful contact more effective?

Production go-live: August 1, 2026

Daily outreach activity

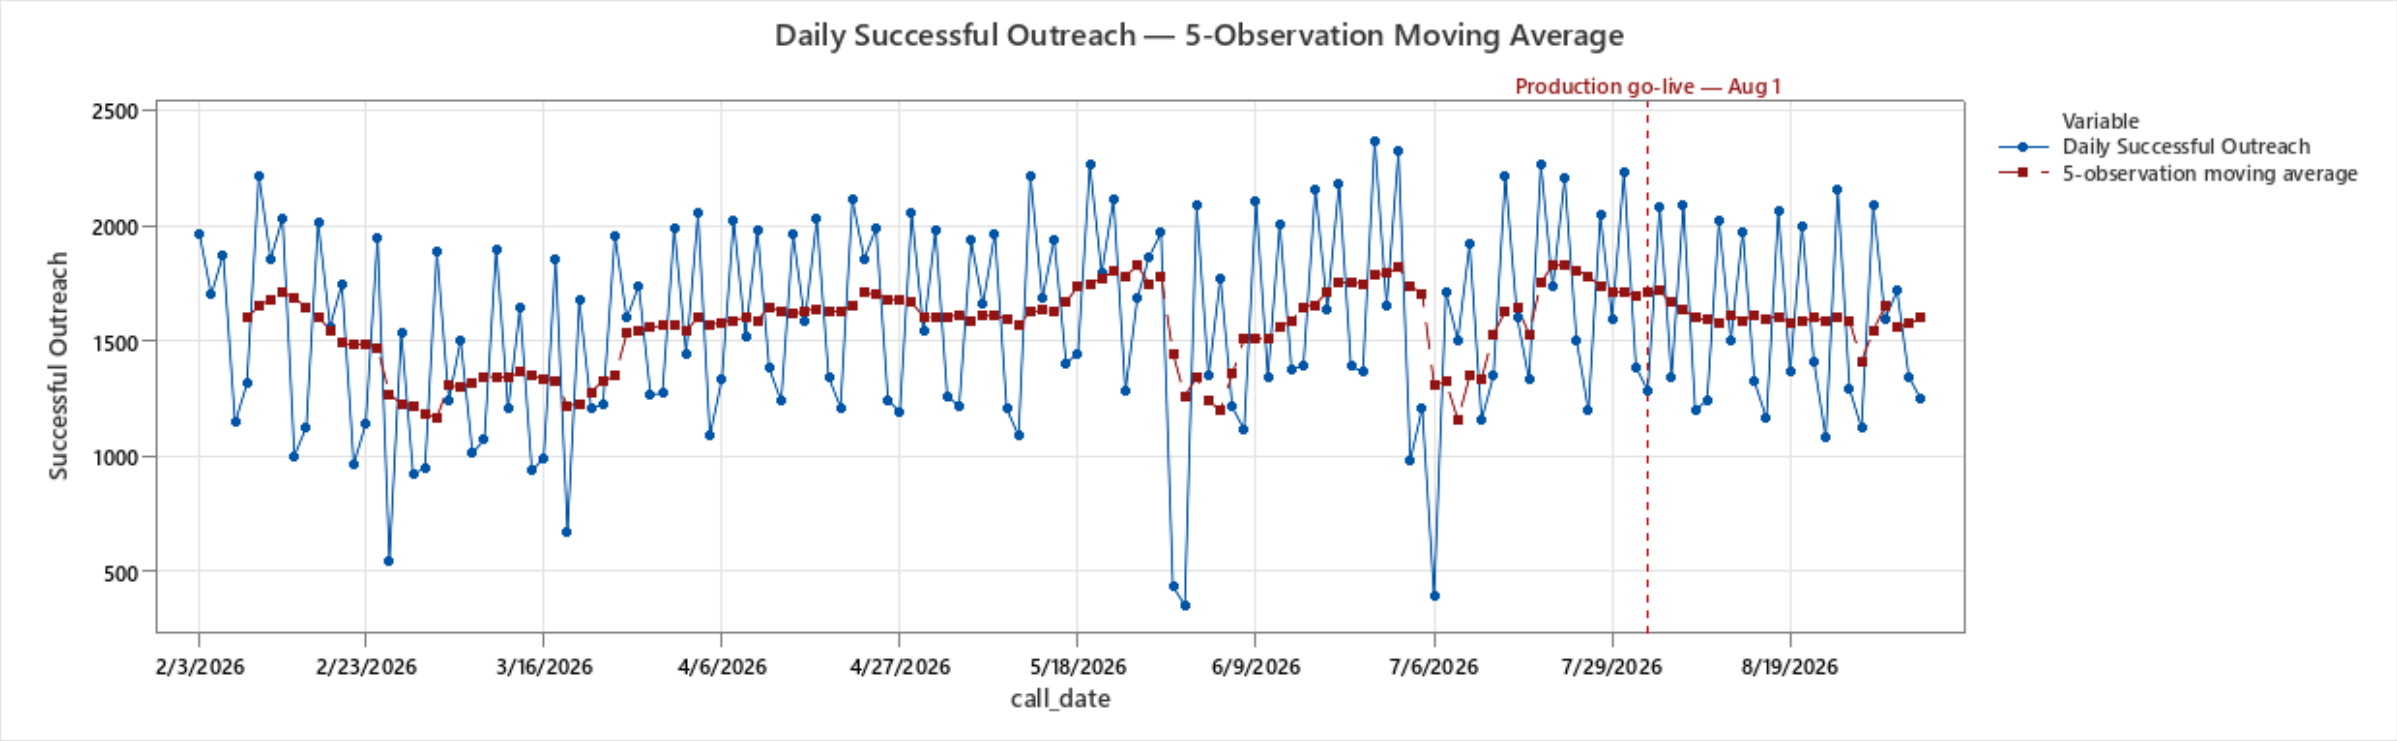

Production go-live: August 1, 2026

Daily activity varies considerably. During early production, the moving average stays broadly level, with no clear sustained increase in total attempts.

Successful outreach shows no sustained increase

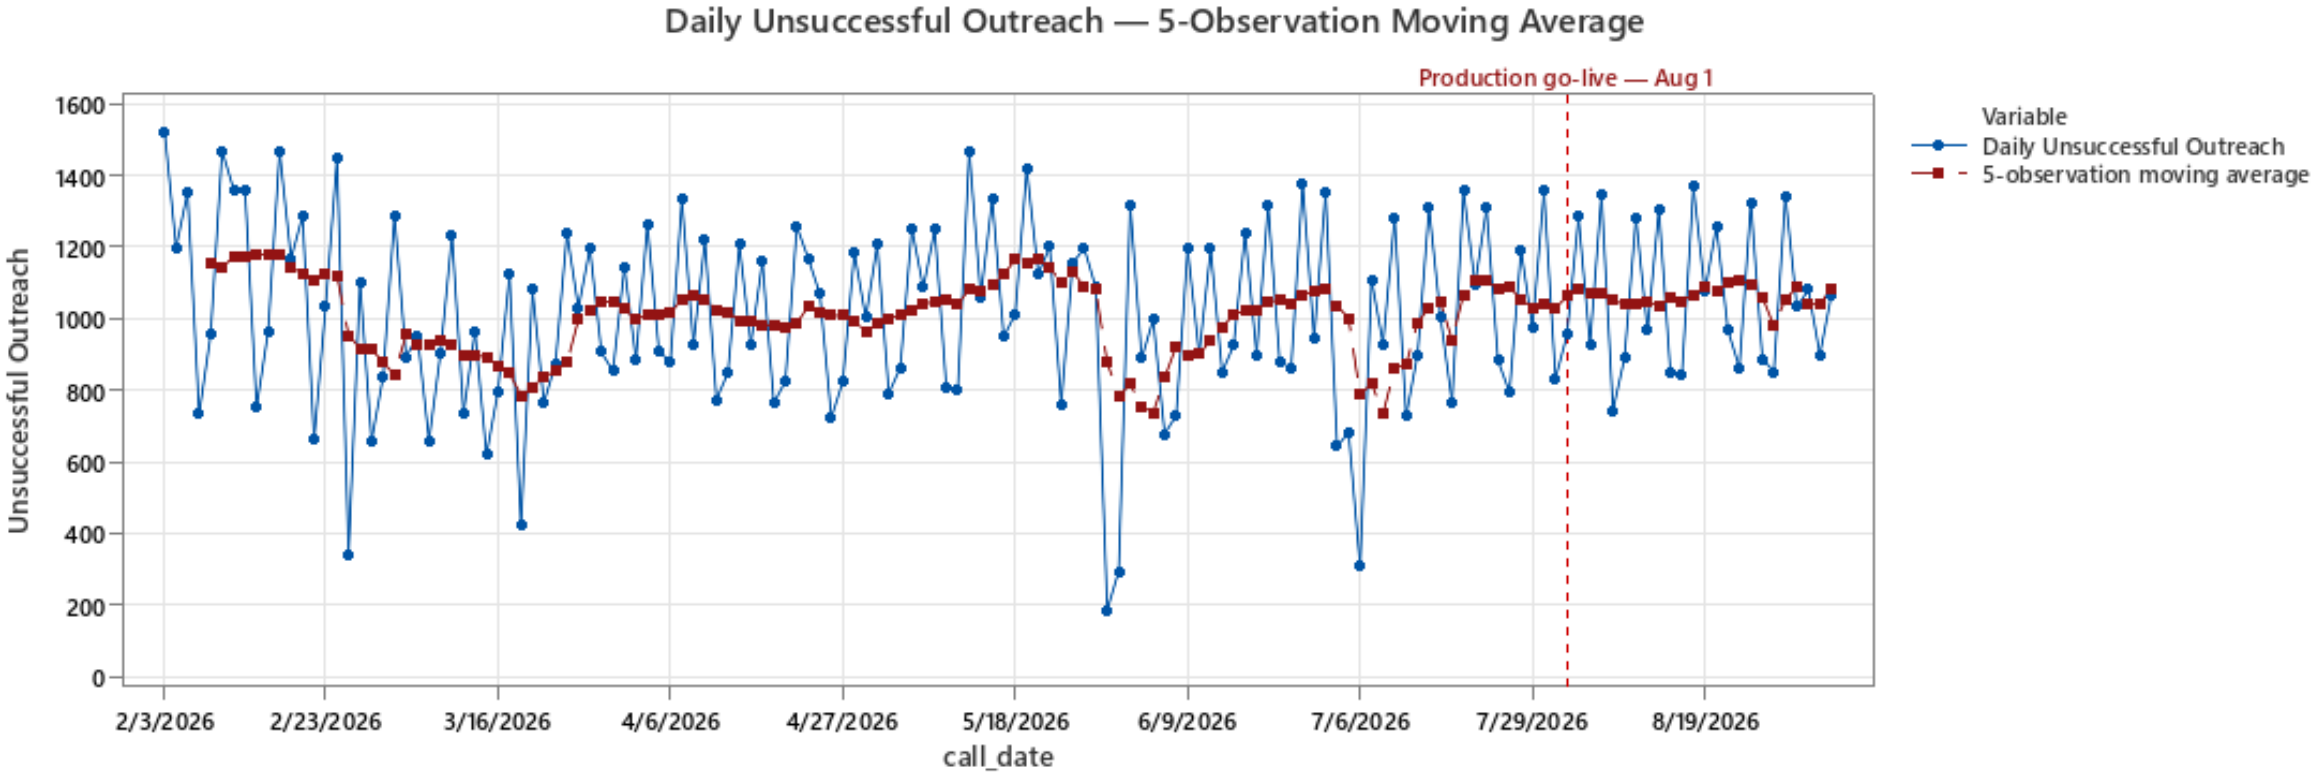

Production go-live: August 1, 2026

Successful outreach fluctuated before go-live. After August 1, the moving average settles below the late-July peak, with no clear sustained increase yet.

Unsuccessful outreach remains an opportunity

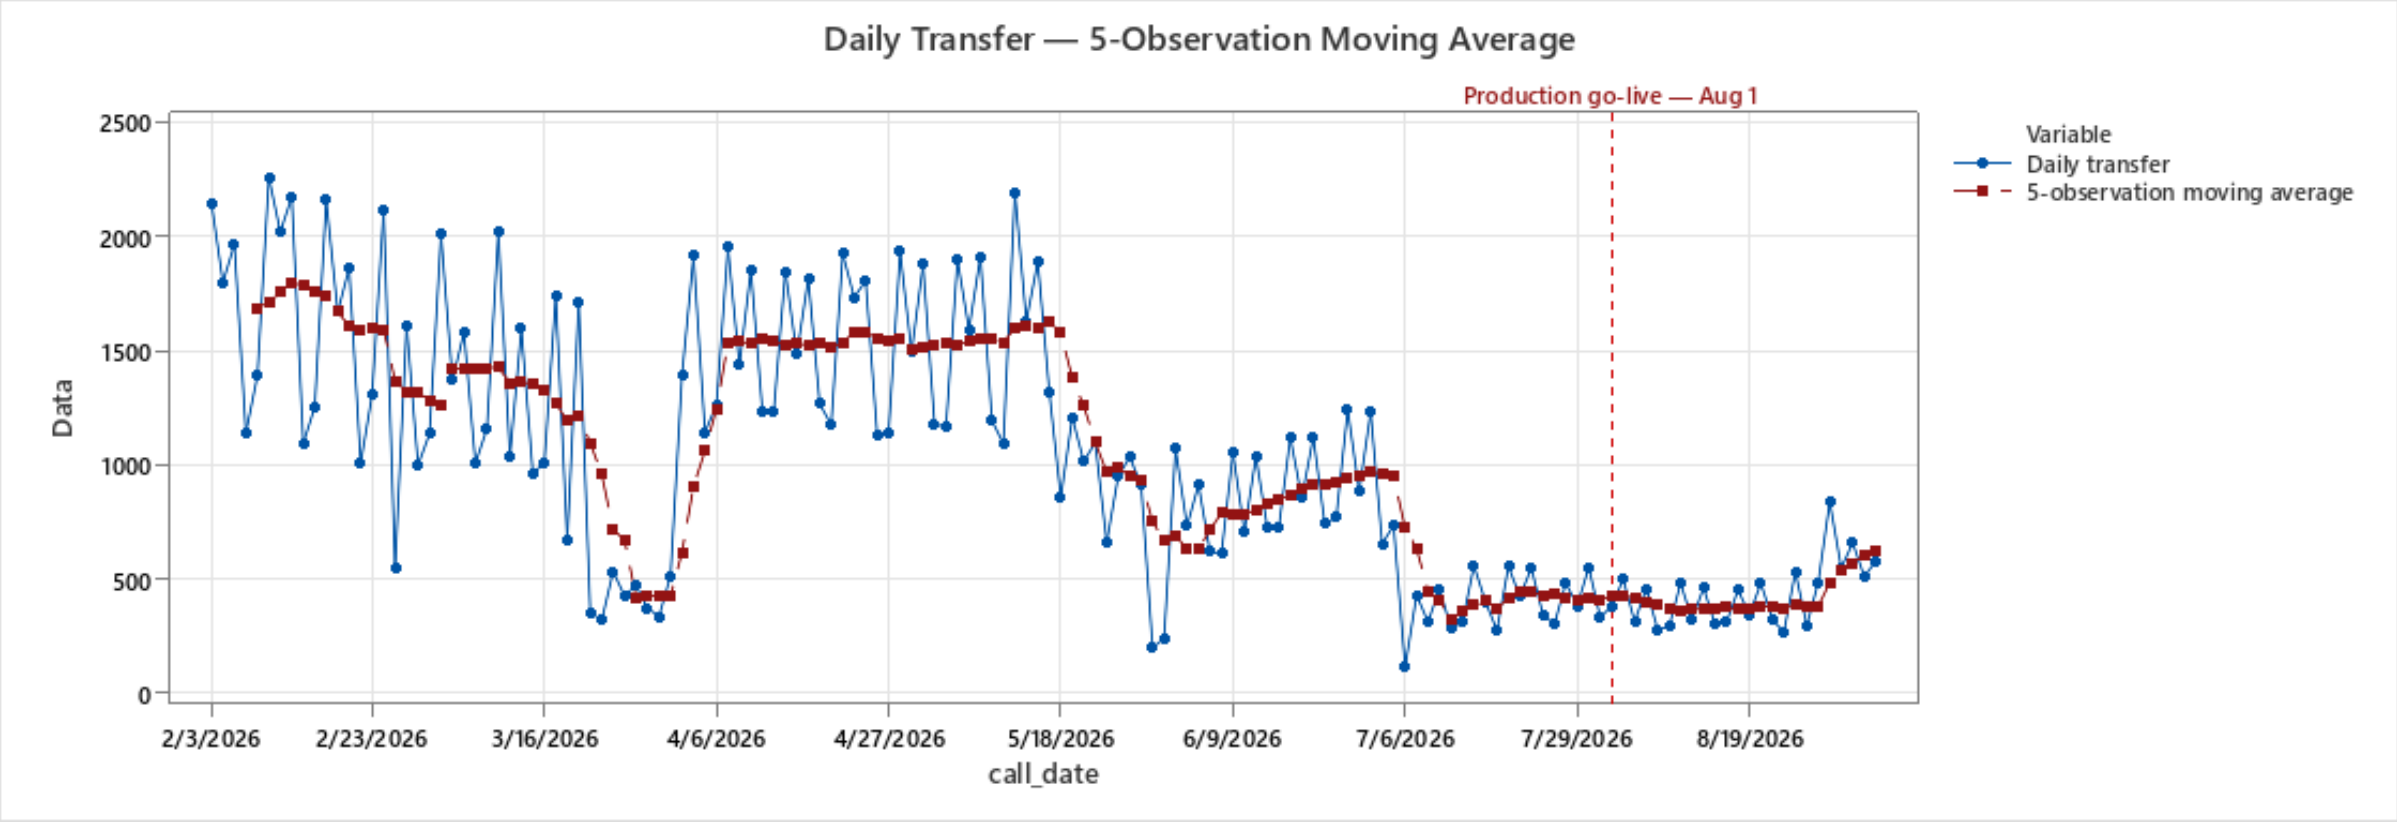

Production go-live: August 1, 2026

The moving average remains broadly around 1,000 unsuccessful attempts per recorded day during early production. There is no clear sustained reduction after go-live.

The transfer decline began before production

Production go-live: August 1, 2026

Transfer volume declined before go-live and was already low by July. It remains lower during early production, so the decline predates the August 1 launch.

Where can we act while we keep monitoring?

While we continue monitoring the overall trend, where can we act now to improve outreach success?

376,524
outreach attempts

60.6%
successful outreach

39.4%
unsuccessful outreach

The next opportunity is in the contacts and reasons behind unsuccessful attempts.

The contact-level results show repeated incorrect-number outcomes and closed-office calls to numbers that were also reached successfully.

Successful outreach means contact was made. The analysis describes the supplied call records.

EST has the most recorded closed-office calls

8,282 calls tagged Closed Office came from numbers labeled EST: 64.2% of all recorded closed-office calls.

Time-zone label	Attempts	Closed office	% of attempts
EST	226,845	8,282	3.65%
CST	73,287	2,179	2.97%
PST	44,721	1,564	3.50%
MST	21,343	707	3.31%

EST contributes the most closed-office calls by volume. Recorded closure rates across the four major zones range from 2.97% to 3.65%.

Volume and success rate identify different priorities

Selected numbers show how closure volume and contact success differ.

Dialed number (as stored)	Zone	Attempts	Closed office	Success rate
988918585541212	PST	415	28 (6.7%)	52.0%
988913126663494	CST	218	25 (11.5%)	62.4%
988912073967830	EST	76	22 (28.9%)	46.1%
988912813424530	CST	95	21 (22.1%)	38.9%
988912405025437	EST	50	16 (32.0%)	22.0%

The highest closure count is 28. Other numbers have fewer attempts but a larger closure share and lower success.

Closed-office percentages and success rates use all attempts to each number.

110 attempts without a successful contact

Dialed number: 988916468631411 (EST)

110
attempts across 49 dates

85
Incorrect Number outcomes

0
successful outreach calls

77.3% of attempts carried an Incorrect Number outcome.

Across 49 recorded dates, this number accumulated 110 attempts without a successful outreach outcome.

The other 25 unsuccessful attempts have no recorded reason.

Most closed-office numbers were also reachable

77.3%

of numbers with a closed-office outcome also had at least one successful contact

6,672 of 8,629 numbers

693

number-and-date combinations had more than one closed-office call

1,471 closed-office calls in these groups

Closed-office outcomes often occurred on numbers with a history of successful contact.

The repeated-call count groups calls by dialed number and date. It does not identify whether calls concern the same claim.

QA opportunities within successful outreach

899 audits of successful outreach calls, August 3-31, 2026. Auditors made the final tagging decisions.

QA parameter	Partial	Failed	Below fully met
Complete documentation	84	10	94 / 899 (10.5%)
Resource utilization	18	31	49 / 899 (5.5%)
Listening	43	1	44 / 896 (4.9%)
Obtain missing billing information	31	11	42 / 899 (4.7%)
Patient verification	0	37	37 / 899 (4.1%)
Accurate system updates	0	30	30 / 898 (3.3%)

Documentation is the most frequent gap. Resource-use comments provide concrete examples of unnecessary contact.

Partial and failed remain distinct. Denominators exclude blanks. Measures 3.2, 5.2 and 5.3 are outside this review.

Auditors found examples of unnecessary calls

Auditor observation	What this shows
An agent called even though complete insurance information was already available on the requisition.	The required information was available before the call.
Another audit noted that valid insurance information was already available in an internal resource.	An existing internal record already contained the information sought.
In one audited call, notes reflected requisition information rather than details provided during the conversation.	The notes did not reflect information obtained during the conversation.

These examples illustrate specific auditor findings within the wider resource-use and documentation results.

What the analysis tells us

1 Overall productivity

Early production does not yet show a clear sustained increase in successful outreach.

2 Contact success

Repeated incorrect-number outcomes and closed-office calls identify where unsuccessful attempts are concentrated.

3 Quality of successful contact

Auditors identified unnecessary-contact examples and documentation gaps in successful outreach calls.
